TOPMOTIVE jumps into the next level

The self-learning information system NEXT is heralding the future now

Bargteheide, 12.07.2018. Telematics, Big Data and self-learning information systems – at the moment all those topics are discussed by the whole IT-sector. For the Automotive Independent Aftermarket (IAM) *the* TOPMOTIVE Group has the answer now: The producer of software solutions goes more than one step further with its latest product ,TOPMOTIVE NEXT‘ and presents the first generation of self-learning information systems –including gainful functions such as telematics access, a self-learning vehicle file and the best possible information flow in all directions. The family-owned company introduces the innovation at the Automechanika Frankfurt in September. The official release is planned for the beginning of January 2019 through wholesalers.

Always one step ahead

As market leader in catalog and information systems as well as service for the IAM the TOPMOTIVE Group shapes the market and the future of information systems for more than 600.000 repair shops, wholesaler and service points decisively. With the latest product ‘NEXT‘ the developer of software solutions goes more than one step further and presents the first generation of self-learning information systems.

The most important element of ,TOPMOTIVE NEXT‘ is the self-learning vehicle file. An independent and highly integrative data model allows portraying OE-Date, IAM-Data as well as other data sources and combining it in the end. The system saves learnt knowledge and makes it accessible to the user again. Furthermore, the product distinguishes itself by a full telematics access. Being docked with several dongle providers and being the first market player attached to an OE telematics system, ‘NEXT‘ gets access to live data from the vehicles. Afterwards, the uses system uses it for an even more precise identification of parts. Appealing User Experience (UX) und User Interface (UI) assimilates user and system.

For the first time in the market, the company realizes the needs of the customers in an individual, weighted representation. The function ‘Fast calculator‘ enables repair shops with only a few clicks to calculate a service and to order the required parts directly out of the shopping basket from the wholesaler.

“These entire modules make ‘NEXT’ a sustainable application with the best possible information flow in all directions. A self-learning system we are changing the market with, describes Stefan Schneider, member of the management board of the TOPMOTIVE Group.
